WYOMING SUGAR COMPANY

Memo

To: WSC Growers

From: WSC Ag Department & Seed Approval Committee

Date: June 16, 2026

Re: CR+ Spray Requirements

On December 8, 2025, the WSC RSL Seed Approval Committee approved four Cercospora tolerant varieties for commercial sale on a limited basis. American Crystal variety Y299NT+ and Beta Seed variety 329NC, and Beta Seed variety 334NC to be planted with no restriction. SeSVanderHave variety 3341N and American Crystal variety Y408NT+ to be planted no greater than 10% or 20 units of a grower's total acreage.

In addition to the acreage or unit limits allowed per grower, there will be a spray program that must be followed on acres planted to any of the three CR+ varieties. To plant 1 or more CR+ variety, the grower will agree to a mandatory 2-spray program that will take place during the growing season. Depending on the year, a 3rd spray may be required by the company. The first spray will happen at row closure, with a follow up spray 12 days later.

Once seed is purchased and contracting is taking place, the WSC fieldmen need to be notified where CR+ varieties are being planted. If not done at this time it must be done at the time of filling out the post plant Strider forms.

It is imperative to protect this seed technology while we have it. Abuse of these requirements will lead to shorter term efficacy of the seed trait. Negligence could also prevent a grower from being allowed to grow CR+ varieties in future years. The spray program is still being developed but will be available well ahead of use on the 2025 crop.

This notice is being made so seed companies can start to sell seed for the 2026 growing season and growers know the requirements that will go along with planting CR+ varieties. The WSC Board of Directors has required that a grower using a CR+ variety will be required to follow the company recommended spray program or face penalties.

Any questions or concerns can be directed to Kadan Huber or Bryce Vigil.
